

Controlling spontaneous emission with surface waves

Jean-Jacques Greffet

Laboratoire Charles Fabry, Institut d'Optique, CNRS
Université Paris Sud,
Institut Universitaire de France

1) Large electric field

$$\frac{\epsilon_0 E^2}{2} V = \frac{\hbar\omega}{2} \rightarrow E = \sqrt{\frac{\hbar\omega}{\epsilon_0 V}}$$

2) Overlap of electrons and photons in a tiny volume

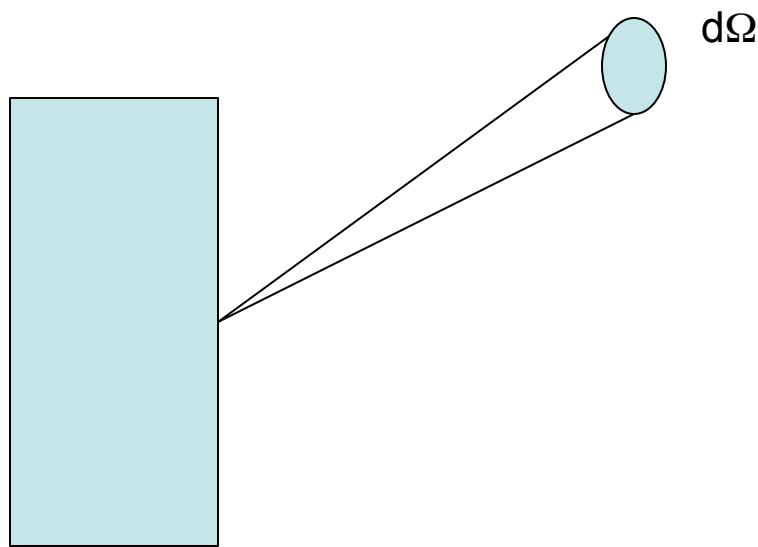

Heterostructures : Alferov

Nanoantennas for Smart IR incandescent sources

Available IR sources ?

- 1. LEDs : low efficiency in the IR**
- 2. Quantum Cascade Lasers**
- 3. OPO**
- 4. Incandescent sources : globars, hot membranes.**

A key concept : Kirchhoff's law

$$d\Phi = I_\lambda dS \cos \theta d\Omega$$

$$I_\lambda = \varepsilon_\lambda(\theta) I_\lambda^o(T)$$

$$\varepsilon_\lambda = \alpha_\lambda = 1 - R_\lambda = T_\lambda$$

(Bad) Features of thermal sources

Low brightness

Narrow spectrum

Directional emission

Improved efficiency

Fast modulation

(Bad) Features of thermal sources

Low brightness

Narrow spectrum

Directional emission

Improved efficiency

Fast modulation

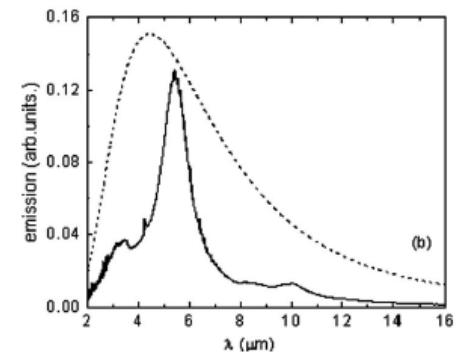

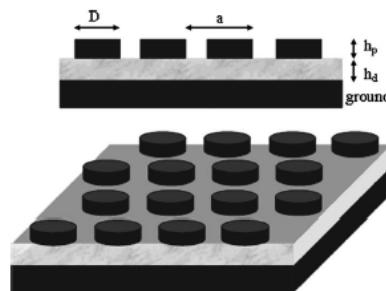

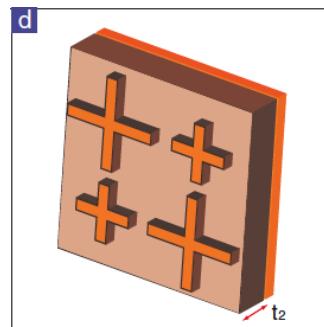

Low brightness

Broad spectrum (low temporal coherence)

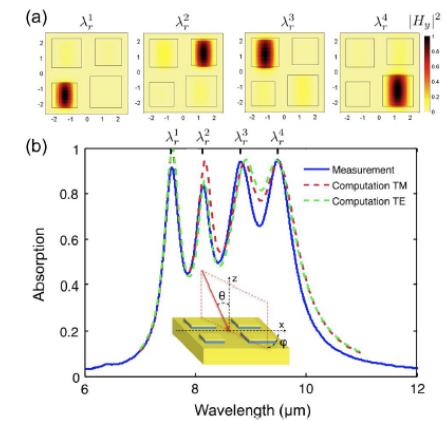

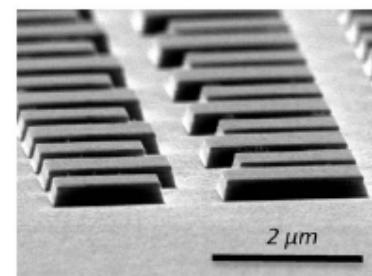

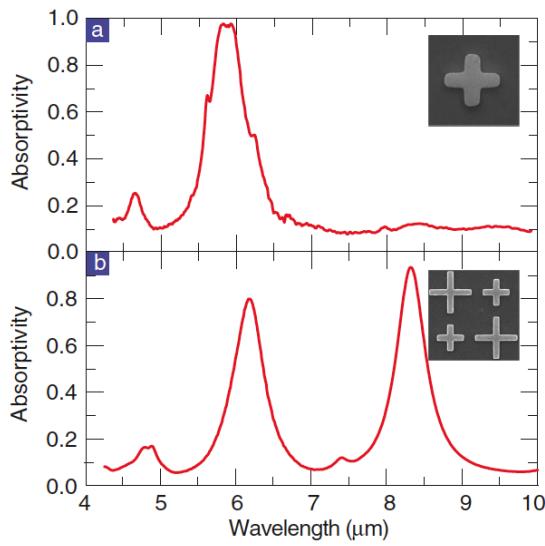

Quasi-isotropic (low spatial coherence)

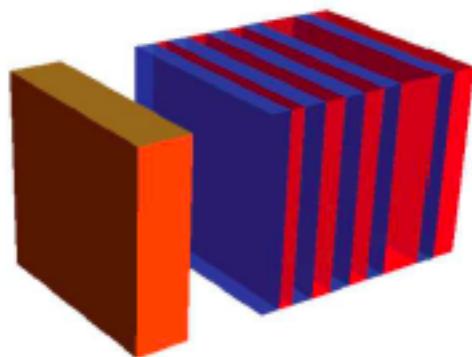

Low efficiency

Slow modulation

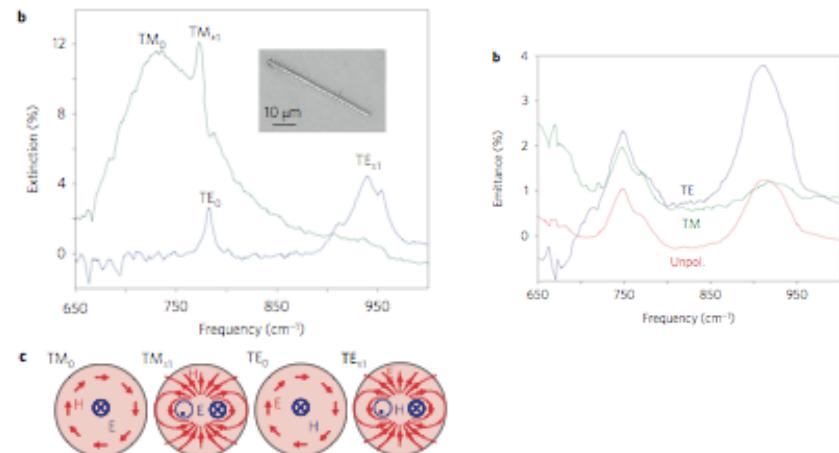

Puscasu, Appl.Phys.Lett. **92**, 233102 (2008)

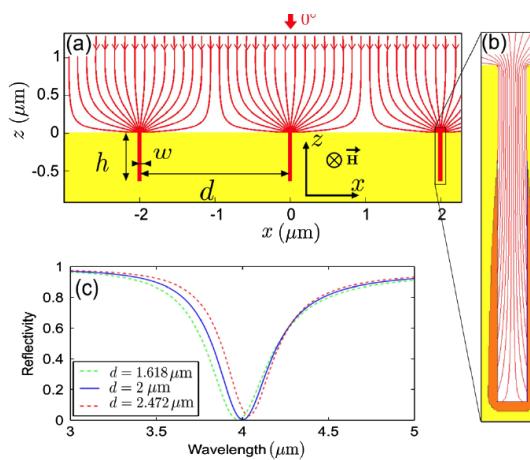

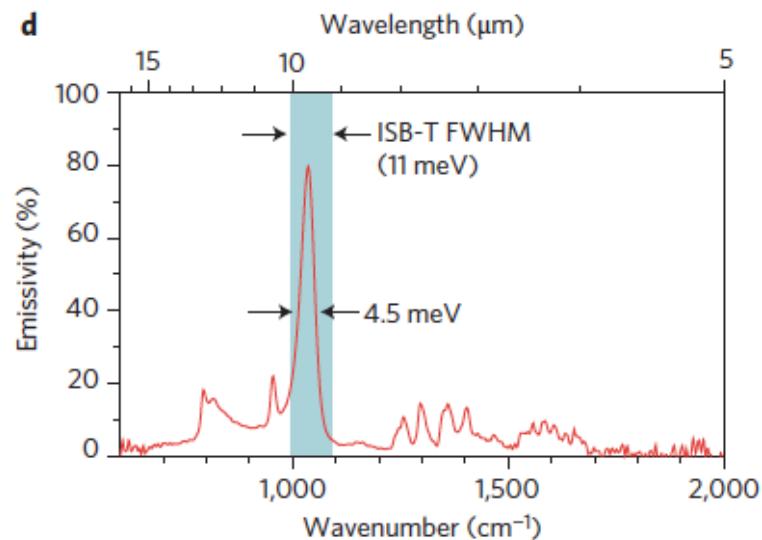

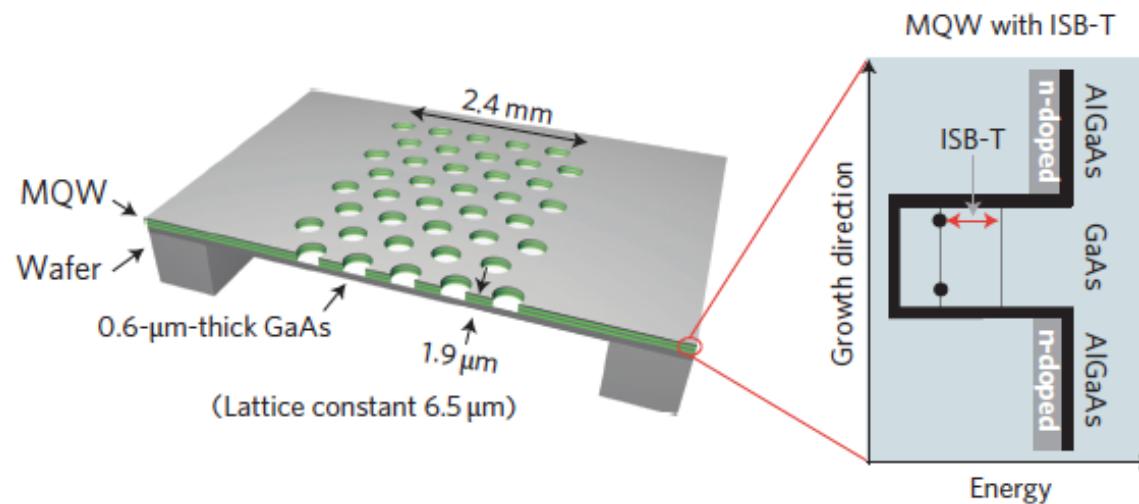

Dielectric stack on a tungsten substrate to filter the emission

J. Schuller et al. *Nature Photonics* 3, 658 (2009)

Narrow Spectrum (temporal coherence)

Low brightness

Broad spectrum (low temporal coherence)

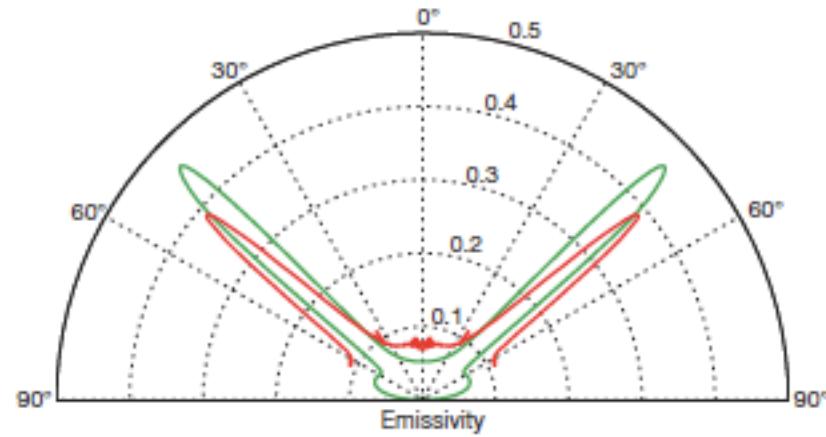

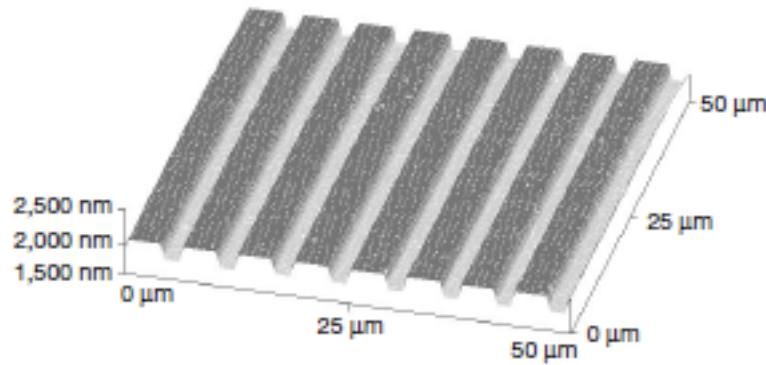

Quasi-isotropic (low spatial coherence)

Low efficiency

Slow modulation

Design strategies :

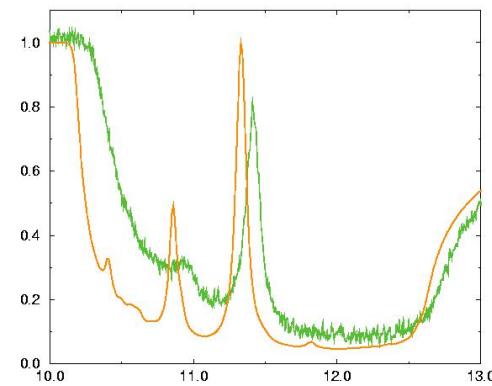

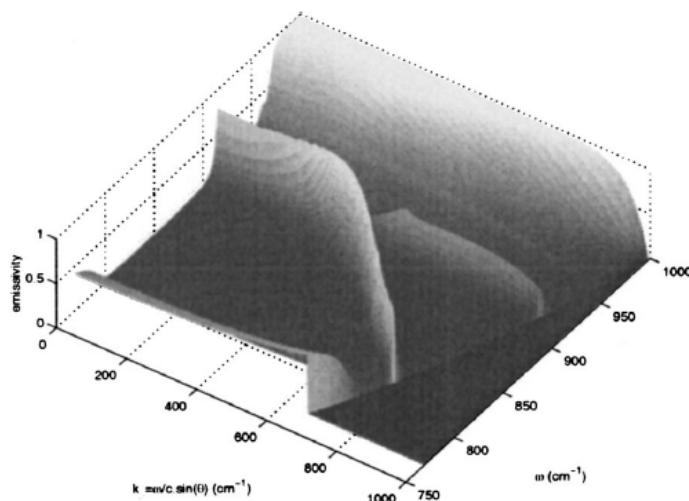

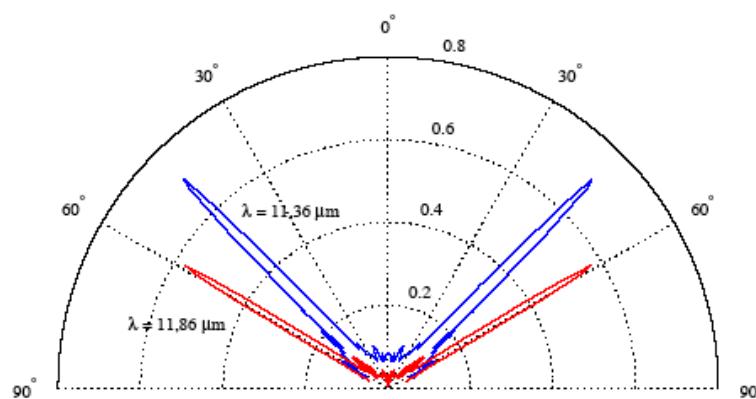

- 1. Use resonant absorption by a surface wave**
- 2. Design a directional transmission filter**

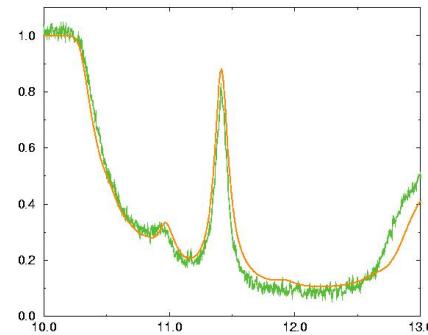

Coherent emission of light by thermal sources

Dispersion relation

Absorption / emission pattern

Low brightness

Broad spectrum (low temporal coherence)

Quasi-isotropic (low spatial coherence)

Low efficiency

Slow modulation

Slow modulation

$$d\Phi = I_\lambda dS \cos \theta d\Omega$$

$$I_\lambda = \varepsilon_\lambda(\theta) I_\lambda^o(T)$$

Modulation is obtained by modulating the temperature.
The cooling dynamics limits the modulation to a few Hz.

Can we solve this problem ?

Slow modulation

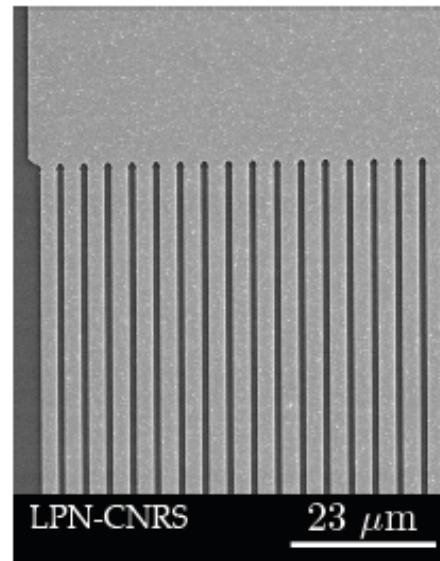

$$d\Phi = I_\lambda dS \cos \theta d\Omega$$

$$I_\lambda = \varepsilon_\lambda(\theta) I_\lambda^o(T)$$

Design strategy :

1. Design a structure with *actively controlled resonant absorption*,

Controlling electrically the emissivity with surface waves

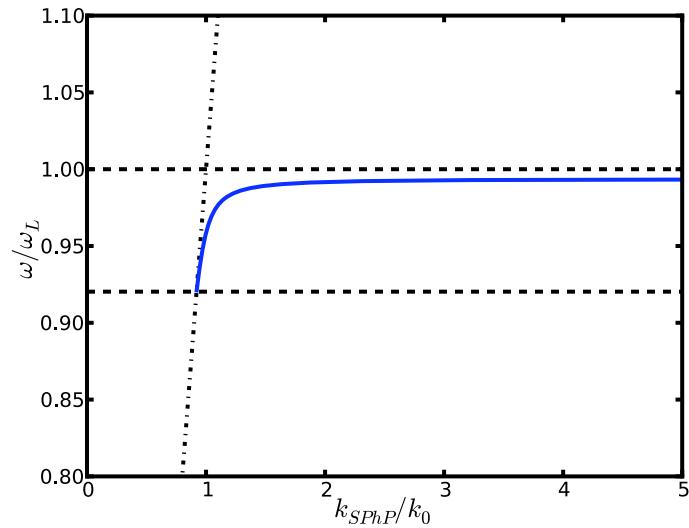

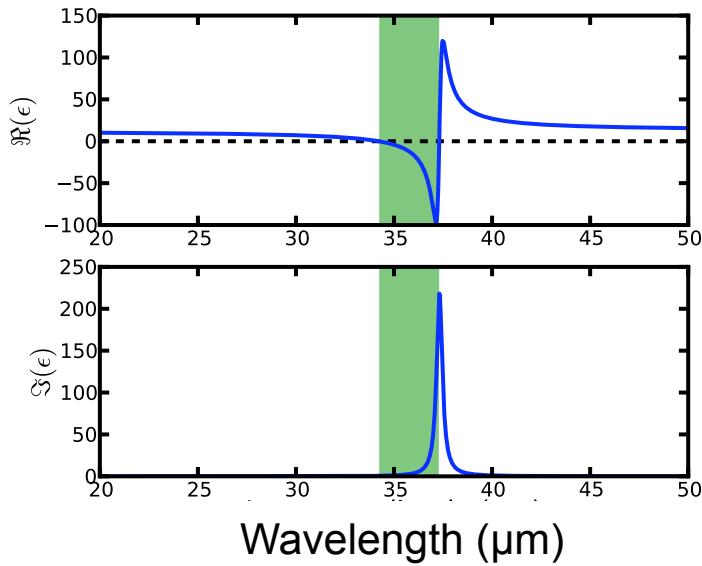

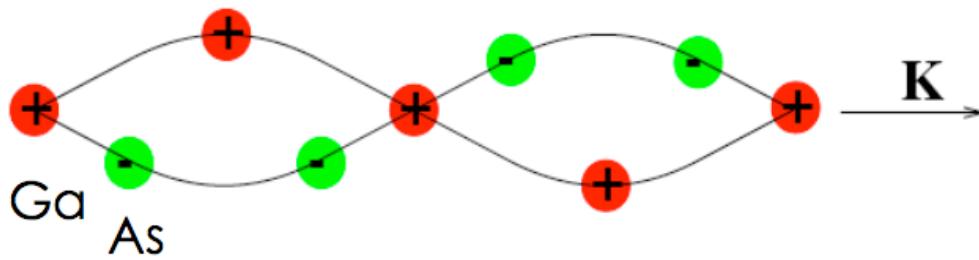

Simon Vassant, Jean-Luc Pelouard, Fabrice Pardo
LPN, CNRS

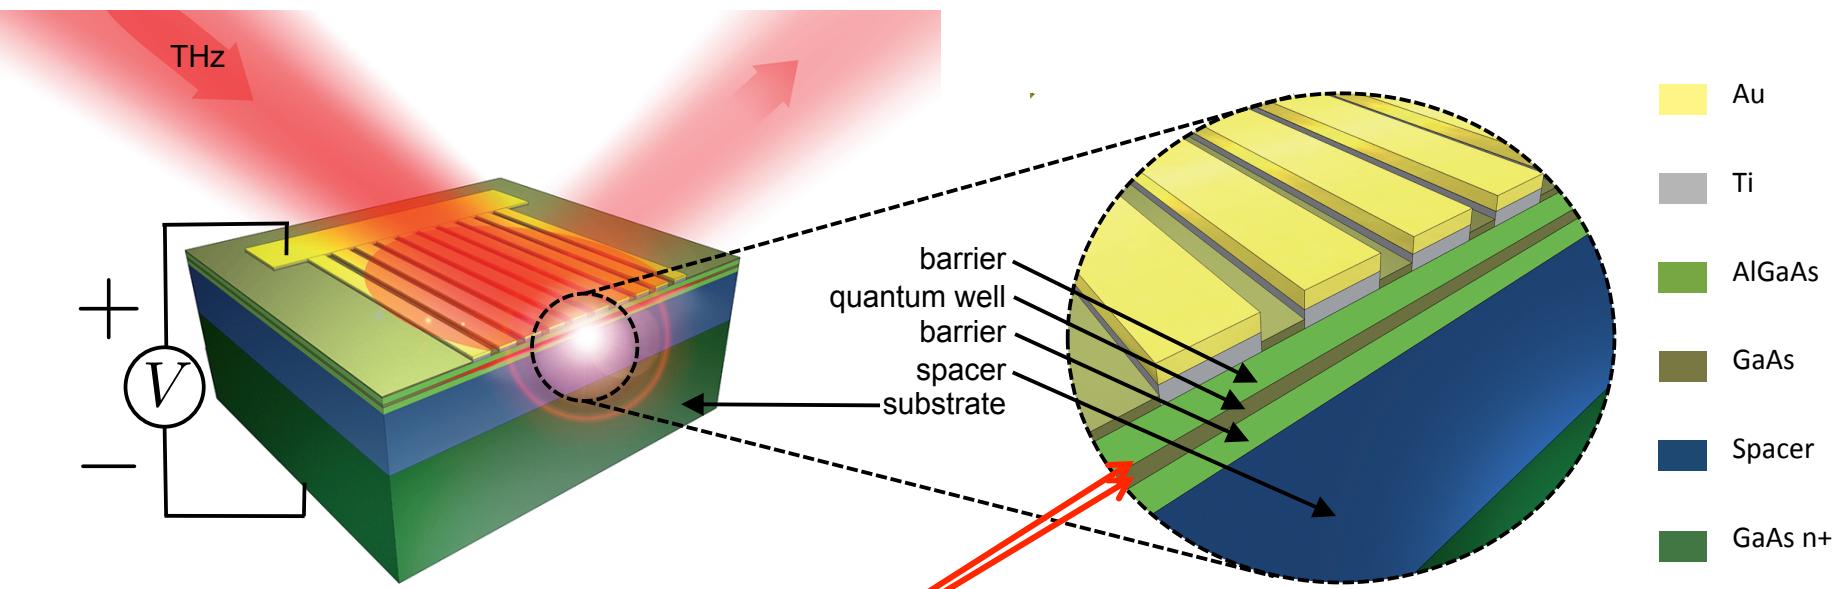

François Marquier

Surface phonon polaritons

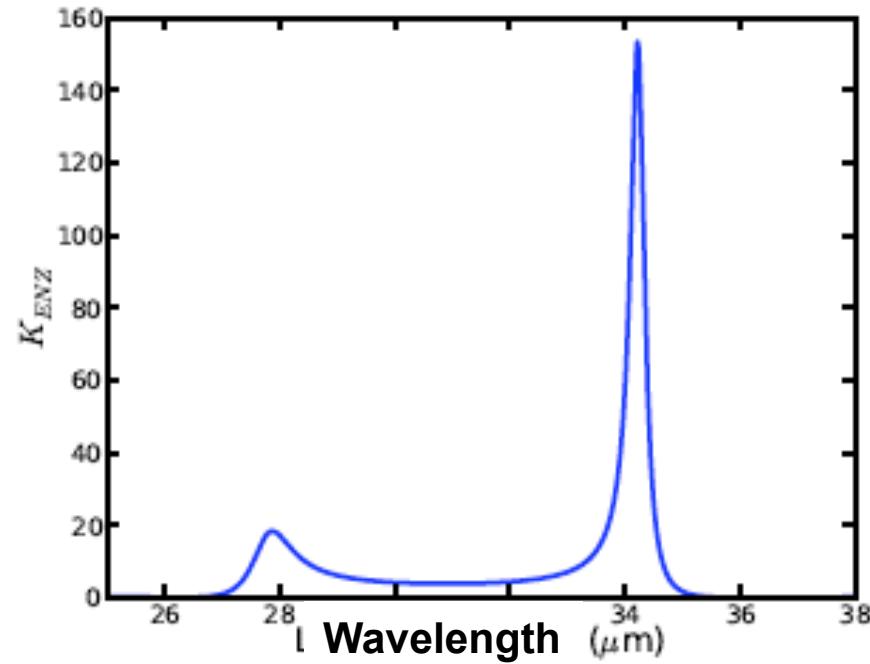

a

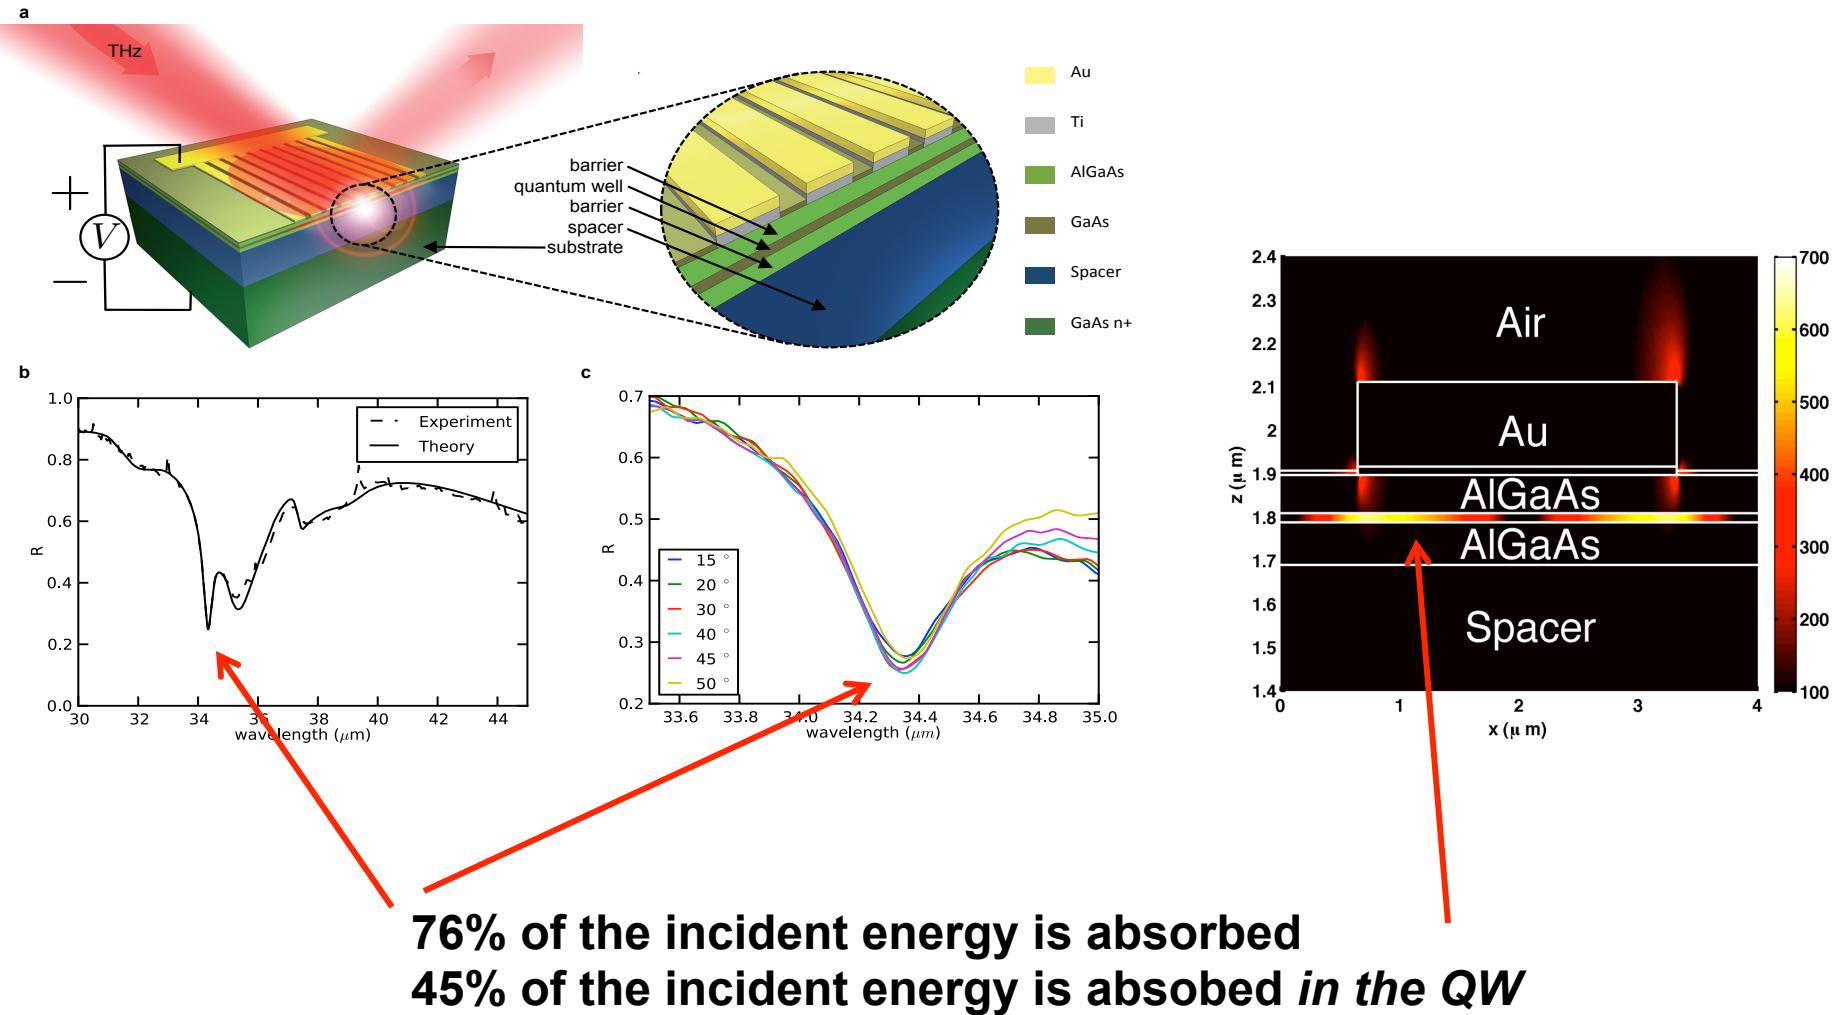

1. Surface mode at the Quantum well interfaces
2. Grating coupler
3. Resonant Intersub-band transitions to control the refractive index in the Quantum well

The Epsilon Near Zero effect

$$\begin{aligned} |E_{zGaAs}|^2 &= \left| \frac{\epsilon_{zAlGaAs}}{\epsilon_{zGaAs}} \right|^2 |E_{zAlGaAs}|^2 \\ &= K_{ENZ} |E_{zAlGaAs}|^2 \end{aligned}$$

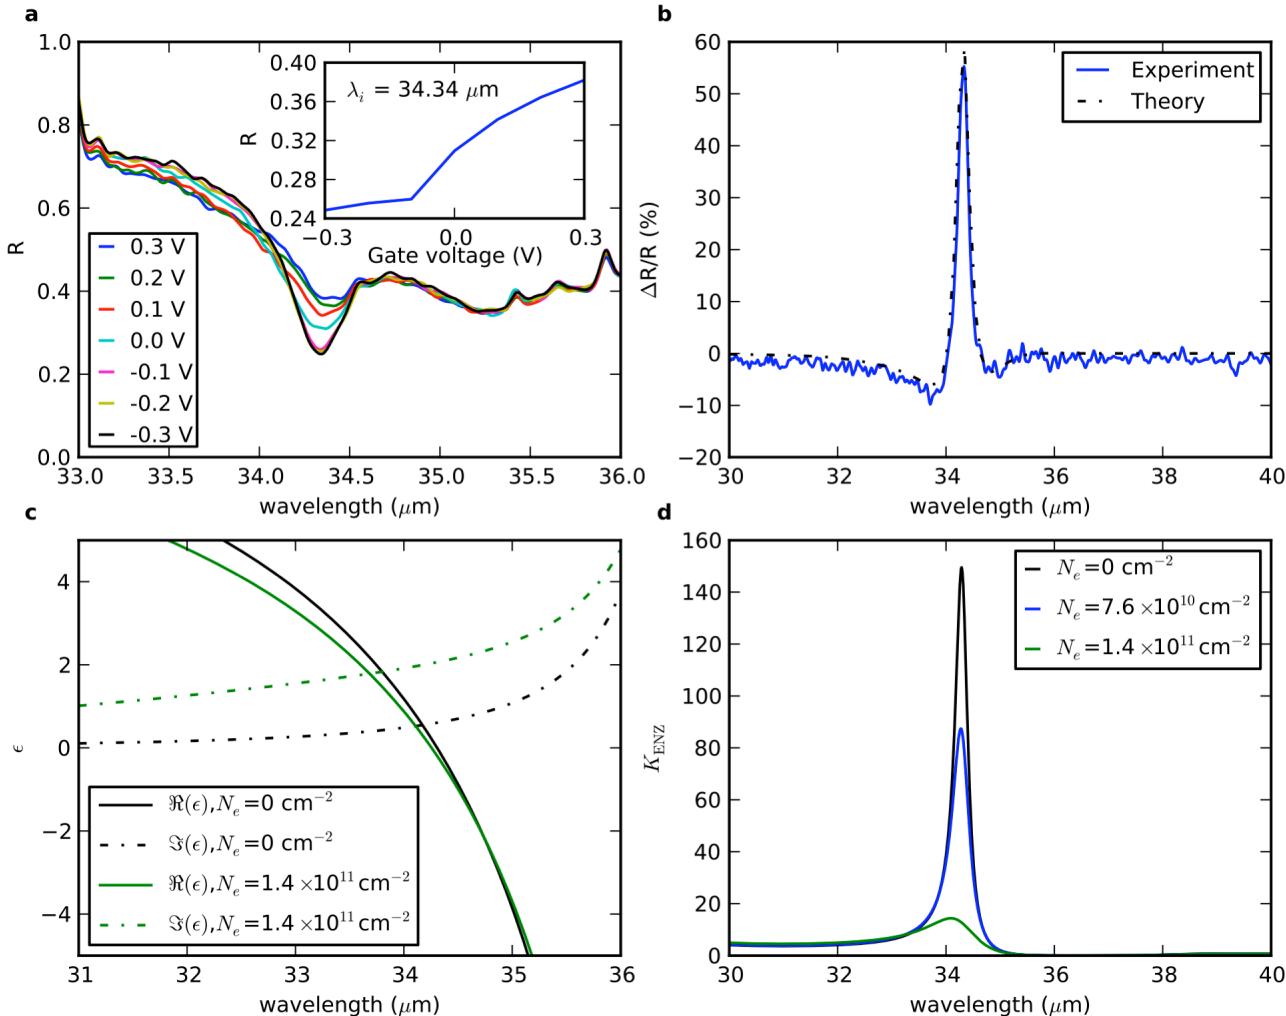

Resonant absorption by a single QW

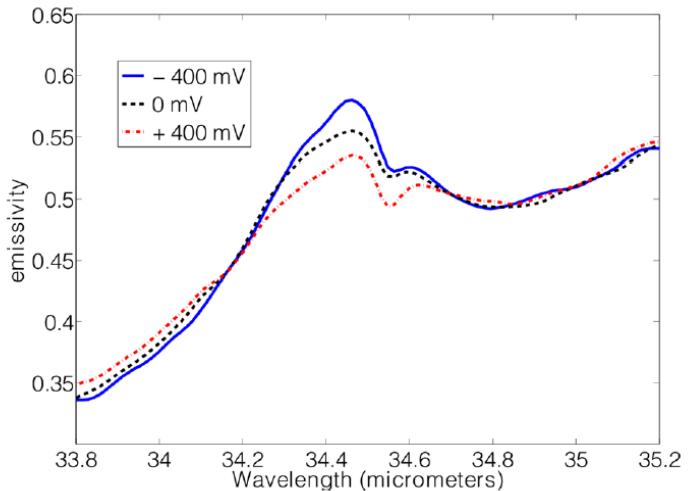

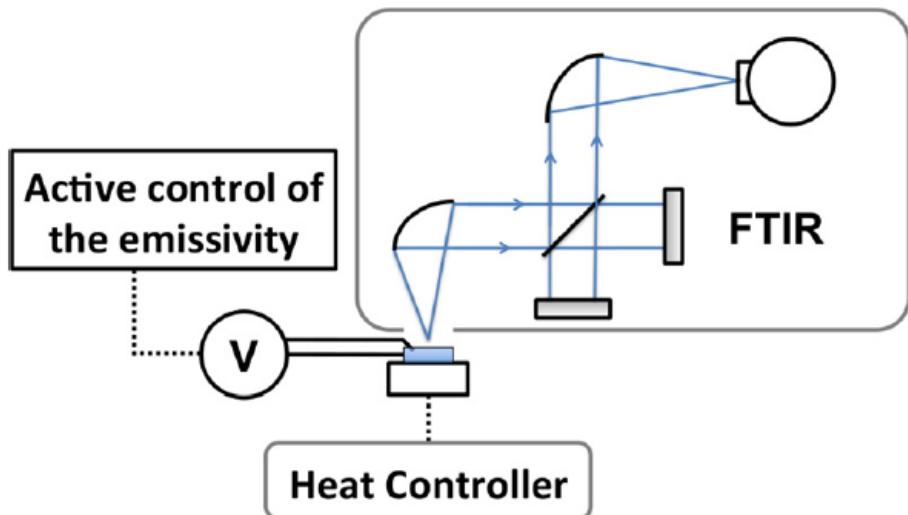

Using electrons to control phonon absorption

$$\epsilon_{zz} = \epsilon_{GaAs} - \sum_{n,n'} \epsilon_\infty \frac{f_{nn'} \omega_p'^2}{\omega^2 - \omega_{nn'}^2 + i\gamma_{isb}\omega}$$

$$\omega_p'^2 = \frac{(N_n - N_{n'})e^2}{\epsilon_0 m^*}$$

Electrically modulated emissivity

Plasmonic nanoantennas for single photon emission

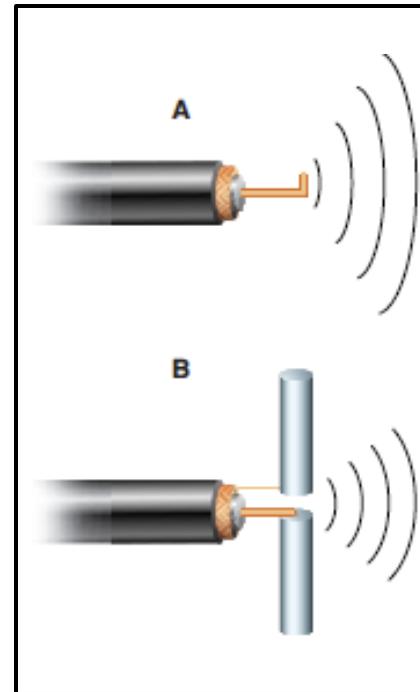

Goal of an antenna

Increase the coupling
between :

a localized source/
detector

and

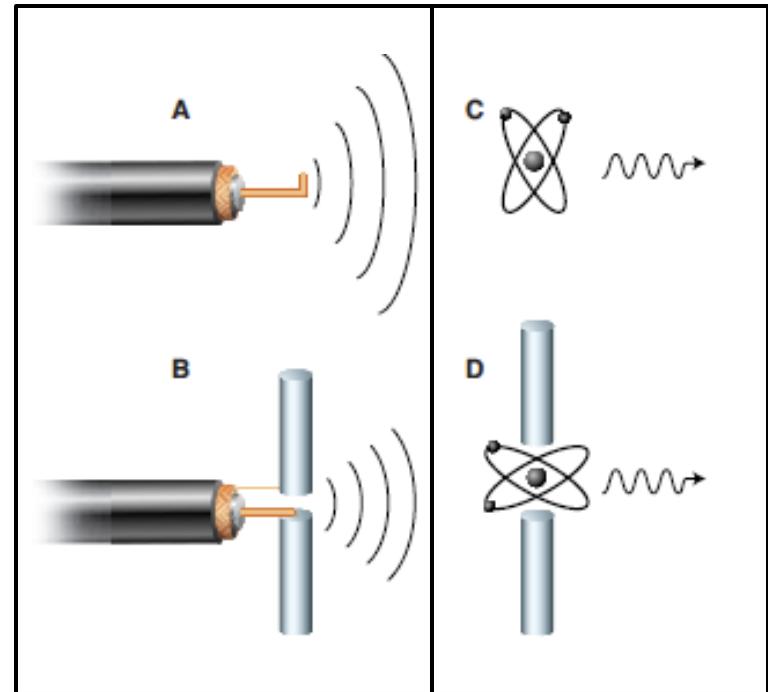

propagating waves

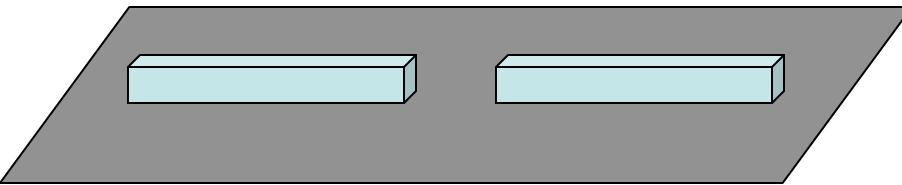

Goal of an antenna for single photon emission

Reduce the decay time

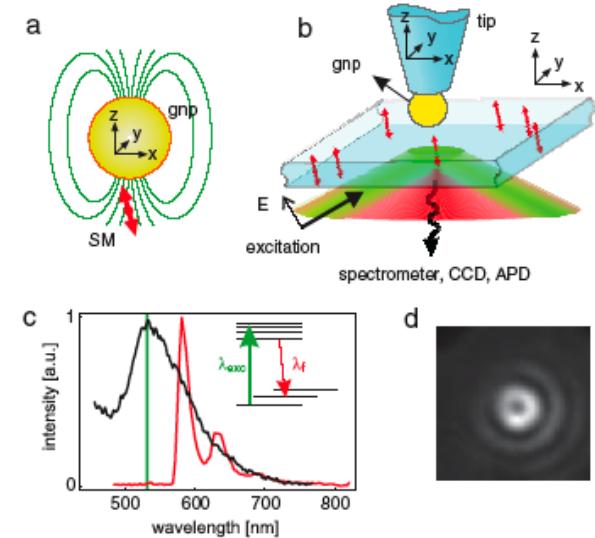

Collect all the emitted photons

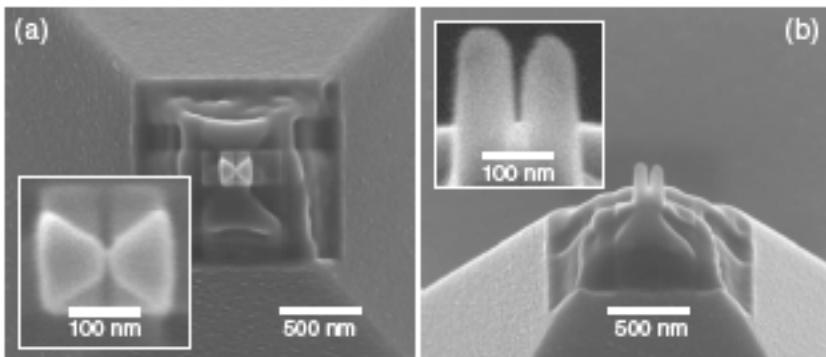

Nanoantennas
